DIGITAL PHOTOGRAMMETRY ACCURACY DECLARATION

Digital map data contained in this file was collected by photogrammetric methods. Reasonable procedures have been adhered to with regard to photo scale, equipment, calibration and operator experience to achieve the accuracy required for the scope of work.

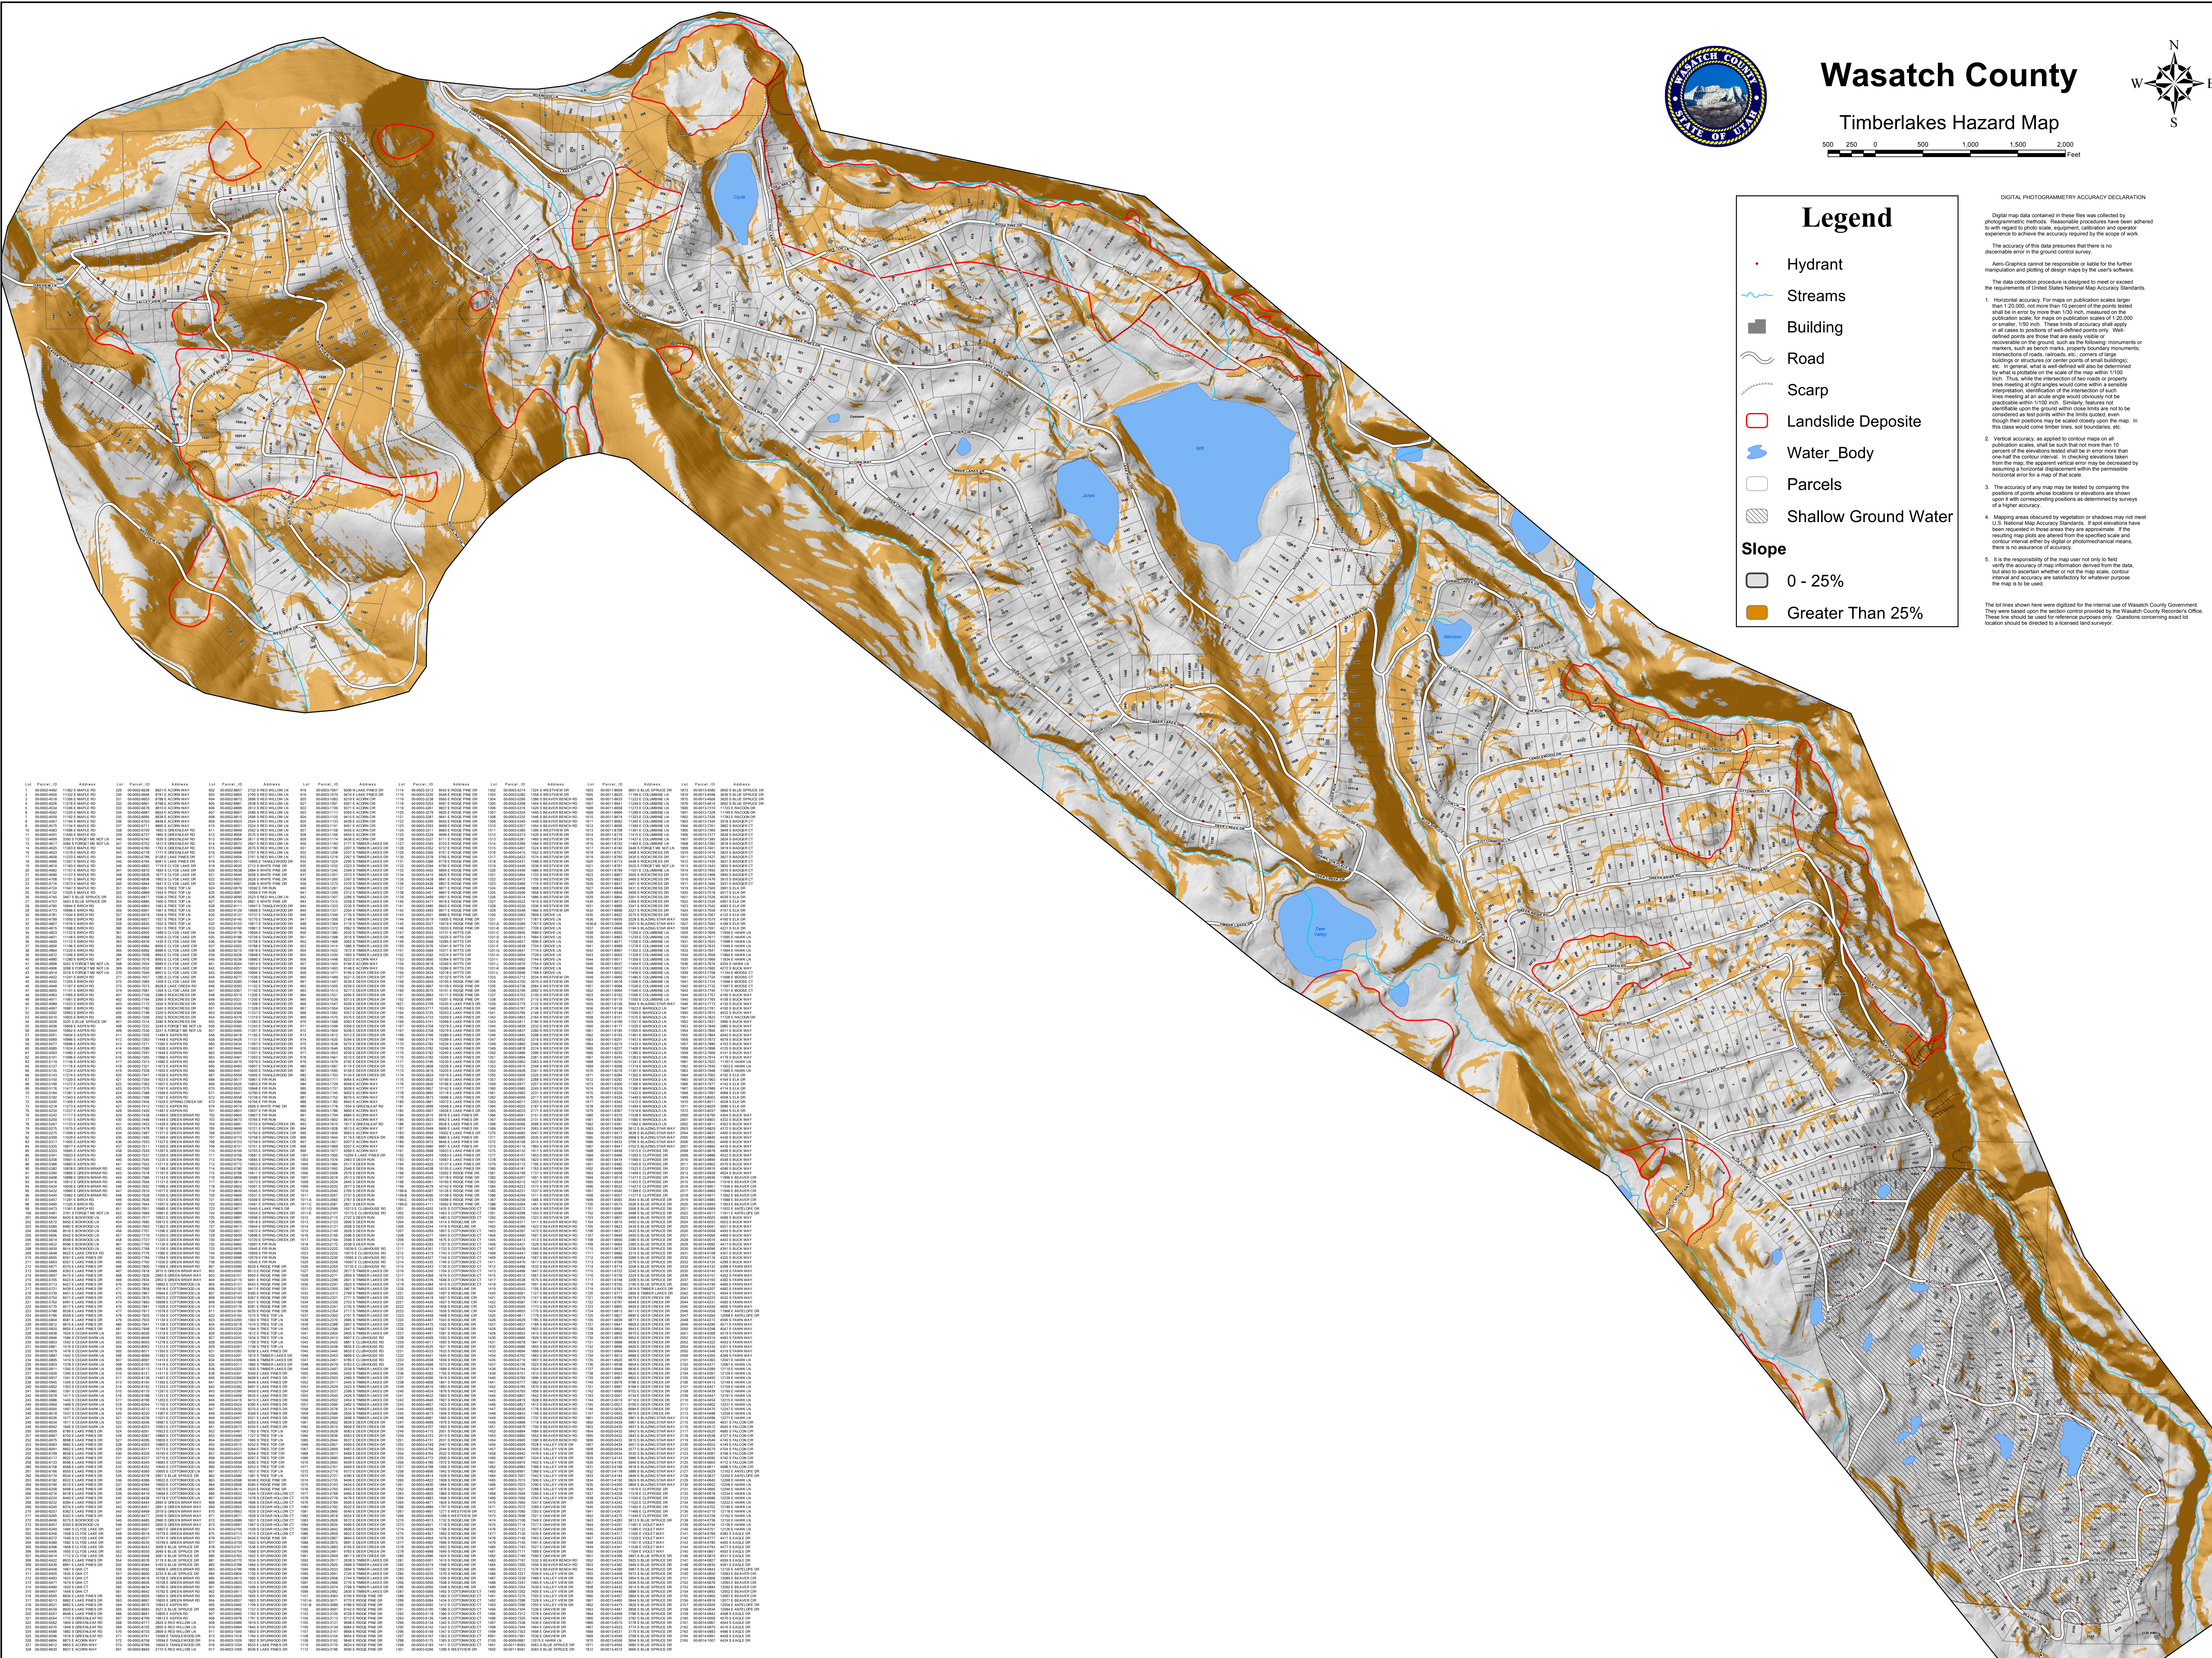

The accuracy of this data presumes that there is no discernible error in the ground control survey.

Aero-graphics cannot be responsible or liable for the further manipulation and plotting of design maps by the user's software.

The data collection procedure is designed to meet or exceed the requirements of United States National Map Accuracy Standards.

- Horizontal Accuracy:** For maps on publication scales larger than 1:20,000, not more than 10 percent of the points tested shall be in error by more than 1/30 inch, measured on the publication scale. For maps on publication scales of 1:20,000 or smaller, 100 each. These limits of accuracy shall apply in all cases to positions of well-defined points only. Well-defined points are those that are clearly visible, identifiable, or measurable on the ground, such as the following: monuments or markers, such as bench marks, property boundary monuments, structures or structures of small buildings; etc. That which is not clearly visible on the ground, but which can be identified by what is possible on the scale of the map within 1/30 inch. Thus, while the intersection of lines or property lines meeting at right angles would come within a sensible interpretation, identification of the intersection of such lines meeting at an acute angle would obviously not be practicable within 1/30 inch. Similarly, features not identifiable upon the ground within close limits are not to be considered as points within the limits quoted, even though their positions may be scaled closely upon the map. In this case would come fence lines, soil boundaries, etc.
- Vertical Accuracy:** as applied to contour maps on all publication scales, shall be such that not more than 10 percent of the elevations tested shall be in error more than one-half the contour interval. In checking elevations based from the map, the apparent vertical error may be decreased by averaging horizontal requirements within the permissible horizontal error for a map of that scale.
- Accuracy of any map may be tested by comparing the positions of points whose locations or elevations are known upon it with corresponding positions as determined by surveys of a higher accuracy.**
- Mapping areas obscured by vegetation or shadows may not meet U.S. National Map Accuracy Standards. If spot elevations have been requested in those areas they are approximate. If the resulting map plots are altered from the specified scale and contour interval either by digital or photomechanical means, there is no assurance of accuracy.
- It is the responsibility of the map user not only to test work for accuracy of map information, but also to accept the accuracy of the map scale, contour interval and accuracy as satisfactory for whatever purpose the map is to be used.

The lot lines shown here were digitized for the internal use of Wasatch County Government. They were based upon the section corner provided by the Wasatch County Recorder's Office. These lines should be used for reference purposes only. Questions concerning exact location should be directed to a licensed land surveyor.
